

Neat Storm installation guide

1. Download and unzip the application from Neat Storm web page.
2. Create a database in you database management system an a user able to manage it. Then, import [neatstorm.sql](#) to that database.
3. Edit the database connection configuration file [application/config/database.php](#):
 - [hostname](#): the domain where your database management system is hosted.
 - [username](#): the username of an administration profile that has permission to manage the new database.
 - [password](#): the password of the previously mentioned database management profile.
 - [database](#): the name of the database previously created.
4. Edit the configuration of the application to set your base url in [application/config/config.php](#):
 - [base_url](#): the full name of your hosting domain where the application will be uploaded.
5. Edit the admin access configuration file [application/config/admin_config.php](#):
 - [admin_password](#): the hash resulting of an MD5 encrypted password. This hash can be obtained using any encrypting tool such as the one provided by [md5online.org](#).
6. Upload all files inside neatstorm folder to your hosting via FTP, this can take a while.
